

MS MODULE - SHIP'S CERTIFICATES & EVENTS MANAGEMENT SYSTEM

InfoSHIP® MS module has been developed to meet the requirements in terms of Quality & Compliance. The module combines a range of functions that allows to manage issues coming under, for example, SMS/OHS 18001, ISO 9001:2000, ISO 14001:2004/EMAS, ISPS, for the organization of Quality, Safety, Environmental and Compliance needs of Ship Operators. Its aim is to improve the management standards requested and/or desired.

MS module provides full traceability of occurrences such as Incident, Accident/Injury and Near-Misses as well as their Follow up (analysis, preventive and corrective actions).

InfoSHIP® MS module is an integrated part of InfoSHIP®. This organic nature allows the full identification and traceability of all the activities carried out and of the corresponding events.

In this way, Maintenance, Purchasing and Quality Control are an integral part of the same system; the relations between them can be mapped, traced and managed, process by process whereby avoiding duplication and redundancy.

The module includes the documentation relating to Quality & Compliance which is organized, updated and automatically distributed throughout the fleet, as well as it allows to evaluate processes whereby being a true decision support system.

MS MODULE SECTIONS

Certificates & documents management

The aim is the management of on board Certificates and, simultaneously, enabling shore side operations to control such management.

Management of the revision and control of obligatory certificates and documents is, of course, foreseen as a function.

The module functionalities, as applied to certificates, may be extended to any other type of documentation (e.g. SMS procedures).

Safety equipment module

PMS SAFETY - Management covers inventories as well as control and execution of inspections required for single items. The coding of Safety Equipment/Outfitting items enables their cataloguing according to class, family (size) and single item or group of items.

TMSA - The module contains, as integrated feature, the ability to respond to some of the TMSA requirements (Tanker Management & Self Assessment).

Reporting System Database

This area of the MS module collects information relating to events identifiable as Hazardous Situations (Incident, Accident, Near Misses) and their Follow Up. The system allows to trace and classify potential nonconformities.

The advantages offered by such a database are evident: the structured collection of data related to risk situations surveyed on board, provides an accurate analysis as well as an effective basis to manage and control the intervention actions (these too can be categorized) and the measures put in place to handle such events.

IB SOFTWARE

IB is a software-house highly committed in the world of Asset Management since 1983. The company is today a market leader in the supply of software systems dedicated to this specific and vast subject.

IB designs, deploys and implements its systems in different market areas (Marine, Industrial, Healthcare and Real Estate). IB provides systems and services for Maintenance & Operations improvements, with a special focus on:

- Technologies
- Methodologies
- Re-engineering of processes and
- Human Resources Expertise.

IB is RINA partner as regards software solutions and specific consulting for Shipping Companies, with particular attention to issues relating to the Technical Management (**InfoSHIP®**) and Energy Efficiency (**InfoSHIP® EGO** - Energy Governance).
